#### ABSTRACT:

This invention relates to compounds that inhibit farnesyl-protein transferase and ras protein farnesylation, thereby making them useful as anti-cancer agents. The compounds are also useful in the treatment of diseases, other than cancer, associated with signal transduction pathways operating through ras and those associated with proteins other than ras that are also post-translationally modified by the enzyme farnesyl protein transferase. The compounds may also act as inhibitors of other prenyl transferases, and thus be effective in the treatment of diseases associated with other prenyl modifications of proteins.

## INHIBITORS OF FARNESYL PROTEIN TRANSFERASE

### Field of the Invention

5  
This invention relates to compounds that inhibit farnesyl-protein transferase and ras protein farnesylation, thereby making them useful as anti-cancer agents. The compounds are also useful in the treatment of diseases, other than cancer, associated with signal transduction pathways  
10 operating through ras and those associated with proteins other than ras that are also post-translationally modified by the enzyme farnesyl protein transferase. The compounds may also act as inhibitors of other prenyl transferases, and thus be effective in the treatment of diseases associated with other prenyl modifications of proteins.

### Background of the Invention

The mammalian ras gene family comprises three genes, H-ras, K-ras and N-ras. The ras proteins are a family of GTP-binding and hydrolyzing  
20 proteins that regulate cell growth and differentiation. Overproduction of normal ras proteins or mutations that inhibit their GTPase activity can lead to uncontrolled cell division.

The transforming activity of ras is dependent on localization of the protein to plasma membranes. This membrane binding occurs via a series  
25 of post-translational modifications of the cytosolic Ras proteins. The first and mandatory step in this sequence of events is the farnesylation of these proteins. The reaction is catalyzed by the enzyme farnesyl protein transferase (FPT), and farnesyl pyrophosphate (FPP) serves as the farnesyl group donor in this reaction. The ras C-terminus contains a sequence motif  
30 termed a "Cys-Aaa<sub>1</sub>-Aaa<sub>2</sub>-Xaa" box (CAAX box), wherein Cys is cysteine, Aaa is an aliphatic amino acid, and Xaa is a serine or methionine. Farnesylation occurs on the cysteinyl residue of the CAAX box (cys-186), thereby attaching the prenyl group on the protein via a thio-ether linkage.

The compounds of formulas I-IV may form salts with alkali metals such as sodium, potassium and lithium, with alkaline earth metals such as calcium and magnesium, with organic bases such as dicyclohexylamine, 30 tributylamine, pyridine and amino acids such as arginine, lysine and the like. Such salts may be obtained, for example, by exchanging the carboxylic acid protons, if they contain a carboxylic acid, in compounds I-IV with the desired ion in a medium in which the salt precipitates or in an aqueous medium followed by evaporation. Other salts can be formed as known to those 35 skilled in the art.

The compounds for formulas I-IV may form salts with a variety of organic and inorganic acids. Such salts include those formed with hydrogen

chloride, hydroxy methane sulfonic acid, hydrogen bromide, methanesulfonic acid, sulfuric acid, acetic acid, trifluoroacetic acid, maleic acid, benzenesulfonic acid, toluenesulfonic acid and various others (e.g., nitrates, phosphates, borates, tartrates, citrates, succinates, benzoates, ascorbates, salicylates and the like). Such salts may be formed by reacting compounds I-IV in an equivalent amount of the acid in a medium in which the salt precipitates or in an aqueous medium followed by evaporation.

In addition, zwitterions ("inner salts") may be formed.

Compounds of the formulas I-IV may also have prodrug forms. Any compound that will be converted in vivo to provide the bioactive agent (i.e., the compound for formulas I-IV) is a prodrug within the scope and spirit of the invention.

For example compounds of the formulas I-IV may be a carboxylate ester moiety. The carboxylate ester may be conveniently formed by esterifying any of the carboxylic acid functionalities found on the disclosed ring structure(s).

Various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

- a) **Design of Prodrugs**, edited by H. Bundgaard, (Elsevier, 1985) and **Methods in Enzymology**, Vol.42, p. 309-396, edited by K. Widder, et al. (Academic Press, 1985);

10 **Use and Utility**

The compounds of formulas I-IV are inhibitors of S-farnesyl protein transferase. They are thus useful in the treatment of a variety of cancers, including (but not limited to) the following;

- carcinoma, including that of the bladder, breast, colon, kidney, liver, lung, including small cell lung cancer, ovary, prostate, testes, pancreas, esophagus, stomach, gall bladder, cervix, thyroid and skin, including squamous cell carcinoma;
- hematopoietic tumors of lymphoid lineage, including leukemia, acute lymphocytic leukemia, acute lymphoblastic leukemia, B-cell lymphoma, T-cell lymphoma, Hodgkins lymphoma, non-Hodgkins lymphoma, hairy cell lymphoma, and Burketts lymphoma;
- hematopoietic tumors of myeloid lineage, including acute and chronic myelogenous leukemias, myelodysplastic syndrome and promyelocytic leukemia;
- tumors of the central and peripheral nervous system, including astrocytoma, neuroblastoma, glioma, and schwannomas;
- tumors of mesenchymal origin, including fibrosarcoma, rhabdomyosarcoma, and osteosarcoma;
- other tumors, including melanoma, xenoderma pigmentosum, keratoactanthoma, seminoma, thyroid follicular cancer and teratocarcinoma.

30 The compounds of formulas I-IV are especially useful in treatment of tumors having a high incidence of ras involvement, such as colon, lung, and pancreatic tumors and in tumors in which a prenyl transferase contributes to tumor maintenance, tumor growth or tumor development. By the administration of a composition having one (or a combination) of the compounds of this invention, development of tumors in a mammalian host is reduced, or tumor burden is reduced, or tumor regression is produced.

Compounds of formulas I-IV may also inhibit tumor angiogenesis, thereby affecting the growth of tumors. Such anti-angiogenesis properties of the compounds of formulas I-IV may also be useful in the treatment of certain forms of blindness related to retinal vascularization.

5           Compounds of formulas I-IV may also be useful in the treatment of diseases other than cancer that may be associated with signal transduction pathways operating through ras, e.g., neurofibromatosis, atherosclerosis, pulmonary fibrosis, arthritis, psoriasis, glomerulonephritis, restenosis following angioplasty or vascular surgery, hypertrophic scar formation,  
10 polycystic kidney disease and endotoxic shock. Compounds I-IV may be useful as anti-fungal agents.

          Compounds of formula I-IV may induce or inhibit apoptosis, a physiological cell death process critical for normal development and homeostasis. Alterations of apoptotic pathways contribute to the  
15 pathogenesis of a variety of human diseases. Compounds of formula I-IV, as modulators of apoptosis, will be useful in the treatment of a variety of human diseases with aberrations in apoptosis including cancer (particularly, but not limited to follicular lymphomas, carcinomas with p53 mutations, hormone dependent tumors of the breast, prostate and ovary, and precancerous  
20 lesions such as familial adenomatous polyposis), viral infections (including but not limited to herpesvirus, poxvirus, Epstein-Barr virus, Sindbis virus and adenovirus), autoimmune diseases (including but not limited to systemic lupus erythematosus, immune mediated glomerulonephritis, rheumatoid arthritis, psoriasis, inflammatory bowel diseases and autoimmune diabetes  
25 mellitus), neurodegenerative disorders (including but not limited to Alzheimer's disease, AIDS-related dementia, Parkinson's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, spinal muscular atrophy and cerebellar degeneration), AIDS, myelodysplastic syndromes, aplastic anemia, ischemic injury associated myocardial infarctions, stroke and  
30 reperfusion injury, arrhythmia, atherosclerosis, toxin-induced or alcohol induced liver diseases, hematological diseases (including but not limited to chronic anemia and aplastic anemia), degenerative diseases of the musculoskeletal system (including but not limited to osteoporosis and arthritis), aspirin-sensitive rhinosinusitis, cystic fibrosis, multiple sclerosis,  
35 kidney diseases, and cancer pain.

          Compounds of formulas I-IV may also be useful in the treatment of diseases associated with farnesyl transferase substrates other than ras (e.g.,

nuclear lamins, transducin, rhodopsin kinase, cGMP phosphodiesterase, TC21, phosphorylase kinase, Rap2, RhoB, RhoE, PRL1) that are also post-translationally modified by the enzyme farnesyl protein transferase.

Compounds of formulas I-IV may also act as inhibitors of other  
5 prenyl transferases (e.g., geranylgeranyl transferase I and II), and thus be effective in the treatment of diseases associated with other prenyl modifications (e.g., geranylgeranylation) of proteins (e.g. the rap, rab, rac and rho gene products and the like). For example, they may find use as drugs against Hepatitis delta virus (HDV) infections, as suggested by the  
10 recent finding that geranylgeranylation of the large isoform of the delta antigen of HDV is a requirement for productive viral infection [J. S. Glen, et al., Science, 256, 1331 (1992)].

The compounds of this invention may also be useful in combination with known anti-cancer and cytotoxic agents and treatments, including  
15 radiation. If formulated as a fixed dose, such combination products employ the compounds of this invention within the dosage range described below and the other pharmaceutically active agent within its approved dosage range. Compounds of formulas I-IV may be used sequentially with known anticancer or cytotoxic agents and treatment, including radiation when a

**Step 1**

The first step is accomplished by the reaction of the anthranilic acid with a phosgene equivalent, such as, phosgene or triphosgene in a mixed aqueous/organic solvent at room temperature to 50°C range.

**Step 2**

The product is reacted with an amino acid hydrochloride salt or an amino acid ester hydrochloride salt in pyridine at an elevated temperature with reflux as preferred. Step 2 of Scheme 1 may be performed in 2 steps, wherein the isatoic anhydride is condensed with an amino acid in an organic solvent solvent such as pyridine at from 0°C to reflux and the resulting anthraniloylamino acid is cyclized under standard amide bond forming

conditions, e.g., using HOBt/carbodiimide in an organic solvent such as DMF at from 0°C to room temperature. Some compounds 1 of Scheme 1 wherein R<sub>1</sub> = halogen are not commercially available. Such compounds 3, 4 or 5 of Scheme 1 wherein R<sub>1</sub> = halogen can be prepared from compounds 3, 4 or 5 of Scheme 1 wherein R<sub>1</sub> = hydrogen by halogenation, for example by reaction with bromine in an organic solvent such as acetic acid at from 0°C to room temperature. The compound 3 wherein R<sub>1</sub> is aryl or heteroaryl can be prepared from the compound 3 wherein R<sub>1</sub> is bromo, iodo or trifluoromethanesulfonyloxy by a palladium coupling of an aryl or heteroaryl metalloid derivative such as phenylboronic acid in a mixed aqueous/organic solvent, e.g. THF/DMF/water, in the presence of a base, e.g. sodium carbonate, at from room temperature to 90 °C. (Alternatively, the compound of Scheme 1 where R<sub>1</sub> = aryl or heteroaryl is also prepared from a compound 2 of Scheme 5 where R<sub>1</sub> is bromo, iodo or trifluoromethanesulfonyloxy by reaction with an aryl metalloid derivative such as phenylboronic acid or tributyl-stannylpyridine in a deoxygenated organic (e.g., THF) or mixed aqueous/organic solvent system such as aqueous NaHCO<sub>3</sub>/toluene in the presence of a palladium catalyst such as tetrakis(triphenylphosphine) palladium at from room temperature to 100°C. Deprotection then affords the target compound.) Alternatively such Suzuki or Stille couplings can be performed on a compound 1 of Scheme 1, or on a compound 4 of Scheme 1, or on a compound 5 of Scheme 1 where the unacylated benzodiazepine nitrogen may be optionally protected, e.g., with a trifluoroacetyl group, and subsequently deprotected. The compound 3 wherein R<sub>1</sub> is alkoxy is prepared by alkylation of the corresponding hydroxy compound under standard conditions. The compound 3 wherein R<sub>1</sub> is alkylaminoalkylaryl is prepared from the compound 3 wherein R<sub>1</sub> is an aryl aldehyde by reductive amination under standard conditions.

### 30 **Step 3**

Thereafter the compound 3 is reacted with a reducing agent, such as lithium aluminum hydride or borane in an inert organic solvent, such as, tetrahydro-furan at from room temperature to reflux. If R<sub>1</sub> or R<sub>2</sub> contain functional groups, e.g., CO<sub>2</sub>R, which are reduced by, e.g. lithium aluminum hydride, to, e.g. CH<sub>2</sub>OH, these groups will also be reduced by step 3. The compound 4 or 6 wherein R<sub>1</sub> is CN can be prepared from the compound 4 or 6 wherein R<sub>1</sub> = halogen by displacement with CuCN in an inert solvent such

as NMP at elevated temperature. The compound 4 wherein R<sub>1</sub> is CO<sub>2</sub>H can be prepared from the compound 4 wherein R<sub>1</sub> = CN by hydrolysis, e.g. by heating with aqueous sodium hydroxide in a suitable solvent such as ethanol at 100°C; thereafter the product wherein R<sub>1</sub> = CONR<sub>5</sub>R<sub>6</sub> may be prepared by standard amide bond coupling conditions.

#### **Step 4**

Thereafter the product is acylated or sulfonylated under standard conditions at from -78 °C to room temperature (e.g., by reaction with an acid halide R<sub>3</sub>COX wherein X is Cl or Br in an inert organic solvent, e.g. acetonitrile, or in a mixed aqueous/organic solvent e.g. NaOH/dichloroethane; by reaction with an O-phenyl ester in an inert organic solvent, e.g. acetonitrile; by reaction with a carboxylic acid in the presence of a coupling agent, e.g. DCC or EDC in an inert organic solvent, such as DMF; by reaction with a haloformate such as ethyl, isopropyl or 4-nitrophenylchloroformate in an inert solvent such as dichloromethane at from 0°C to room temperature in the presence of an optional base such as diisopropylethylamine to form carbamates, some of which, e.g. 4-nitrophenyl-carbamate, are reacted with an amine, e.g. N,N,N'-trimethylethylenediamine, at from room temperature to 110°C to form ureas; by reaction with a carboxylic or sulfonyl anhydride such as succinic anhydride or trifluoromethanesulfonyl anhydride in an inert solvent such as ethyl acetate, dichloromethane or pyridine at from 0°C to room temperature in the presence of an optional base such as diisopropylethylamine; by reaction with an isocyanate in an inert solvent such as THF; by reaction with a carbamyl chloride R<sub>5</sub>R<sub>6</sub>NCOX wherein X is Cl or Br in an inert solvent such as acetonitrile in the presence of a base such as diisopropylethylamine/dimethyl-aminopyridine; by reaction with a sulfonyl halide R<sub>3</sub>SO<sub>2</sub>X wherein X is Cl or Br in a mixed aqueous/organic solvent e.g. NaOH/CH<sub>2</sub>Cl<sub>2</sub>; by reaction with a halosulfonate ROSO<sub>2</sub>X wherein X is Cl or Br in an inert solvent such as CH<sub>2</sub>Cl<sub>2</sub>; by reaction with a sulfamoyl chloride R<sub>5</sub>R<sub>6</sub>NSO<sub>2</sub>X wherein X is Cl or Br in an inert solvent such as acetonitrile in the presence of a base such as diisopropylethylamine/dimethyl-aminopyridine; by reaction with an N-cyanothiourea NH(CN)C(S)NR<sub>5</sub>R<sub>6</sub> in the presence of a coupling reagent such as a carbodiimide in an inert solvent such as DMF at about room temperature; by reaction with a cyanocarbonimide such as diphenylcyanocarbonimide

in a suitable solvent such as DMF in the presence of a base such as diisopropylethylamine at from room temperature to 80°C, followed by reaction with an amine such as methylamine at about room temperature). The compound 5 wherein R<sub>1</sub> is halogen, e.g. bromine, may be prepared

5 from the compound 5 wherein R<sub>1</sub> = H by reaction with a halogenating agent, e.g. tetrabutylammonium perbromide, in an inert solvent such as chloroform at about room temperature. Where R<sub>1</sub> or R<sub>2</sub> contain CH<sub>2</sub>OH, the acylation may be performed in such a manner as to obtain the diamide ester; the ester may then be cleaved, e.g., by sodium methoxide in methanol and the

10 resulting alcohol oxidized to an acid, e.g., by Jones reagent; the N<sub>1</sub> amide may then be cleaved, e.g., by KOH in aqueous methanol at reflux, and the acid may be coupled with amines under standard peptide coupling conditions to form compounds 5 of Scheme 1 where R<sub>1</sub> or R<sub>2</sub> is a carboxamide. Where R<sub>1</sub> or R<sub>2</sub> contain CH<sub>2</sub>O-Prot, the protecting group may

15 be removed, e.g., Boc by treatment with an acid such as TFA in an inert solvent such as dichloromethane to form a compound 5 or 6 where R<sub>1</sub> or R<sub>2</sub> is CH<sub>2</sub>OH. The compound 5 where R<sub>1</sub> or R<sub>2</sub> is aryloxyalkyl is prepared from a compound 5 where R<sub>1</sub> or R<sub>2</sub> is CH<sub>2</sub>OH by transformation of the alcohol into a leaving group such as a triflate. e.g., by treatment with triflic anhydride

20 in dichloromethane at -40°C, and displacement with an alkoxide salt, e.g., in dichloromethane at from -40°C to room temperature. The compound 5 where R<sub>1</sub> or R<sub>2</sub> is CH<sub>2</sub>NH<sub>2</sub> is prepared from a compound 5 where R<sub>1</sub> or R<sub>2</sub> is CH<sub>2</sub>OH by transformation of the alcohol into a leaving group such as a triflate. e.g., by treatment with triflic anhydride in dichloromethane at -40°C,

25 and displacement with ammonia, e.g., in dichloromethane at from -40°C to room temperature. The amine may be subsequently coupled to carboxylic acids by standard amide bond coupling conditions. Where the compound 5 is sulfonylated with a beta-haloalkylsulfonyl halide, the halide may then be eliminated by a base such as diisopropylethylamine and then nucleophiles

30 such as dimethylamine or sodium imidazolate may be added to the resulting unsaturated sulfonamide by treatment in an organic solvent such as THF or dichloromethane at from room temperature to reflux. Where the compound 5 is acylated or sulfonylated with an acylating or sulfonylating agent which contains a leaving group, e.g. chloride or bromide, that leaving group may

35 be displaced by nucleophiles, e.g., by amines such as dimethylamine or N-methylpiperazine in an inert solvent such as THF or DMF in the presence of an optional base such as diisopropylethylamine at from 0°C to 110°C.

**Step 5**

Thereafter the various products can undergo reductive alkylation in the presence of an acid e.g. acetic acid, a reducing agent e.g.  $\text{NaBH}(\text{OAc})_3$  in an inert organic solvent e.g. dichloroethane at about room temperature. Reductive alkylation may also be performed using hydrogen and a catalyst such as Pd on carbon in a solvent such as ethanol in the presence of an acid such as acetic acid at about room temperature.

Thereafter, the compound of Scheme 1 where  $\text{R}_1$  = halogen can be metallated and quenched, e.g., with water to form the compound where  $\text{R}_1$  = H or with carbon dioxide to form the compound where  $\text{R}_1$  =  $\text{CO}_2\text{H}$ ; this acid may be coupled with amines under standard peptide coupling conditions to form compounds of Scheme 1 where  $\text{R}_1$  is a carboxamide. The compound of Scheme 1 wherein  $\text{R}_1$  = halogen can be metallated and quenched with a ketone such as cyclohexanone followed by reduction of the alcohol with for example trifluoroacetic acid/sodium borohydride to form the compound where  $\text{R}_1$  = e.g., cyclohexyl. The compound of Scheme 1 in which the imidazole contains a 2-dimethylaminomethyl group can be prepared by standard Mannich conditions. The compound of Scheme 1 in which  $\text{R}_1$  = OH can be prepared from the compound of Scheme 1 in which  $\text{R}_1$  = OMe by dealkylation, e.g., by treatment with  $\text{BBr}_3$ . The compound of Scheme 1 in which  $\text{R}_1$  = arylOalkyl can be prepared from the compound of Scheme 1 in which  $\text{R}_1$  = HOalkyl by Mitsunobu reaction with the aryl alcohol. The compound of Scheme 1 in which  $\text{R}_3$  = aryl- $\text{NH}_2$  or heteroaryl- $\text{NH}_2$  can be prepared from the compound of Scheme 1 in which  $\text{R}_3$  = aryl- $\text{NO}_2$  or heteroaryl- $\text{NO}_2$  by reduction (e.g.,  $\text{SnCl}_2$ ) under standard conditions. The product can be further acylated, sulfonylated or reductively aminated under standard conditions.

### Step 2 and 3

Thereafter the product is monoacylated or monosulfonylated under standard conditions at from  $-78^{\circ}\text{C}$  to room temperature (e.g., by reaction with an acid halide  $\text{R}_2\text{COX}$  wherein X is Cl or Br in an inert organic solvent, e.g. acetonitrile, or in a mixed aqueous/organic solvent e.g. NaOH/methylene chloride; or by reaction with a sulfonyl halide  $\text{R}_3\text{SO}_2\text{X}$  wherein X is Cl or Br in an organic solvent e.g.  $\text{CH}_2\text{Cl}_2$  in the presence of a base such as triethylamine). Thereafter the product undergoes a reductive alkylation as outlined in the last step of Scheme 1.

The compound 2 where an R<sub>1</sub> is R<sub>5</sub>CONH and another R<sub>1</sub> is Br is prepared from the compound where an R<sub>1</sub> is R<sub>5</sub>CONH by bromination, e.g. with tetrabutylammonium tribromide in an inert solvent such as chloroform at about room temperature. Thereafter the compound 2 is reacted with a compound of the formula R<sub>3</sub>COCl in the presence of pyridine

in an inert organic solvent, such as, dichloroethane at from about 0°C to room temperature. Thereafter the compound 3 is deprotected by reaction with, for example, trifluoroacetic acid in an inert organic solvent, such as, dichloroethane at about room temperature. Thereafter the compound 4

5 undergoes reductive alkylation following the steps outlined in Scheme 1.

Scheme 4

In Scheme 4 the compound 1 is reacted with a compound of the formula  $\text{R}_2\text{COCOCO}_2\text{Me}$  in the presence of an organic acid e.g. acetic acid, a

10 reducing agent, such as,  $\text{NaCNBH}_3$  or  $\text{NaBH}(\text{OAc})_3$  in an inert organic

- solvent, such as, dichloroethane at about room temperature. The intermediate is thereafter deprotected by reaction with, for example, trifluoroacetic acid in an inert organic solvent, e.g.  $\text{CH}_2\text{Cl}_2$  at about room temperature, and cyclized by heating, e.g., at  $60^\circ\text{C}$  to form the compound 2.
- 5 Thereafter the compound 2 undergoes reductive alkylation as outlined in Scheme 1 to form a compound 3. The compound 3 may be reduced, e.g. with lithium aluminum hydride, to a compound 4, which may be reacted to form a compound 6 as described in Scheme 12. Alternatively, the compound 2 is reduced to the compound 5, as outlined in Scheme 1, and

Scheme 8

- 5           The compound 1 of Scheme 8 is reacted with an ethylenediamine and the product 2 undergoes reduction, selective acylation or sulfonylation and reductive alkylation to produce a compound 3 as outlined in Scheme 1. Alternatively, Step 1 of Scheme 8 may be performed in 2 steps, wherein the ethylenediamine is condensed with the halogenated heterocycle either neat

Some compounds 1 of Scheme 8 wherein R<sub>1</sub> =

Such compound 2 of Scheme 8 wherein R<sub>1</sub> = halogen can be prepared from compound 2 of Scheme 8 wherein R<sub>1</sub> = hydrogen by halogenation, for example by reaction with bromine in an organic solvent such as acetic acid at from 0°C to room temperature. The compound 2 wherein R<sub>1</sub> = aryl or heteroaryl can be prepared from the compound 2 wherein R<sub>1</sub> is halogen or
- 20   trifluoromethanesulfonyloxy by standard Suzuki or Stille couplings as described for Step 2 of Scheme 1. Thereafter the product undergoes

reduction, acylation or sulfonylation, and reductive alkylation as outlined in Scheme 1. Compound 2 of Scheme 8 may itself undergo reductive alkylation with an imidazole containing aldehyde as outlined in Scheme 1 to afford a target compound.

The product is hydrogenated in an alcohol e.g. ethanol at about room temperature and reduced by reaction with DIBAL in for example dichloroethane at about -78°C. Alternatively, some aminoalkyl containing imidazolylalkanols, prepared by known methods (e.g., Buschauer, et. al., Arch. Pharm., 315, 563, (1982)) are protected with a Boc group as in Scheme 3, step 1, and undergo an oxidation, e.g. under Swern conditions.

15

Scheme 25

- In step 1 of Scheme 25, an N-(2-nitroaryl)-amino acid ester, available by reaction of an amino acid with a 1-fluoro-2-nitrobenzene followed by esterification, is reduced, e.g. with hydrogen and a palladium catalyst in a suitable solvent such as ethyl acetate at about room temperature. The resulting amine is cyclized to a compound 2 under the reduction conditions. The compound 2 is acylated or sulfonylated as described in Step 4 of Scheme 1. The compound 3 is reduced, e.g. with borane in a suitable solvent such as methanol at about room temperature. The compound 3 wherein R<sub>1</sub> is halogen, e.g. bromine, may be prepared from the compound 3 wherein R<sub>1</sub> = H by reaction with a halogenating agent, e.g. tetrabutylammonium perbromide, in an inert solvent such as chloroform at about room temperature. The compound 4 undergoes reductive amination with an imidazole containing aldehyde as described in Step 5 of Scheme 1.

Scheme 26

In step 1 of Scheme 26, the compound 1 is reacted with a methylenating agent such as N,N,N',N'-tetramethyl-diaminomethane in a suitable solvent such as acetic anhydride and DMF at about room temperature. Thereafter, the compound 2 is reacted with a 1,2-phenylenediamine in a suitable solvent such as toluene at about 115°C under dehydrating conditions, e.g. with a Dean-Stark trap, in the presence of a hydroquinone. Thereafter, the compound 3 is both reduced and reductively aminated as described in Step 5 of Scheme 1.

The invention will now be further described by the following working examples(s), which are preferred embodiments of the invention. All temperatures are in degrees Celsius (°C) unless otherwise indicated. These examples are illustrative rather than limiting.

### Examples 101-201

The coupling of each carboxylic acid to Compound B of Example  
10 33 was carried out using standard HOAt / DIC mediated coupling. The  
process was automated by using a Hamilton 2200 Liquid Handler. A Zymark  
Benchmark<sup>®</sup> robotic workstation was used to carry out the weighings of the  
test tubes and for purification of the resulting amide products. An IBM PC  
was used to run the Zymark Benchmark<sup>®</sup> workstation operating program  
15 and to write the Benchmark<sup>®</sup> procedures. The standard protocol for  
preparation of amides is illustrated by the following examples:

A 16 x 100 mm tube was charged with the appropriate carboxylic acid (0.10  
mmol, 1.0 eq) and the Liquid Handler then carried out the following steps on  
the tube:

20 1) Added 0.5 mL of a 0.2 M 1-hydroxy-7-aza-benzotriazole (HOAt) solution in  
DMF

2) Added 0.5 mL of Compound B of Example 33 (0.2 M, 0.10 mmol, 1.0 eq)  
in DMF

25 3) Added 1.0 mL of a methylene chloride solution of diisopropylcarbodiimide  
(0.016 mL, 0.10 mmol, 1.0 eq)

4) Mixed tube contents by vortexing at speed 3 for 30 sec.

After 24 hr, the mixture was concentrated on a Savant Speed Vac (approx. 2  
mm Hg for 72 hr). The residue was purified by ion exchange  
chromatography on a solid phase extraction cartridge mediated by the

30 Benchmark<sup>®</sup> robotic workstation using the following protocol:

1) Added 5.0 mL of methanol/methylene chloride(1:1) to the reaction

2) Mixed tube contents by vortexing at speed 3 for 60 sec

3) Conditioned a Varian solid phase extraction column (1.5 g, SCX cation  
exchange) with 10 mL of methanol/methylene chloride at 0.15 mL/sec

35 4) Loaded reaction contents onto column at 0.02 mL/sec

5) Washed column with 2 x 7.5 mL of methanol/methylene chloride(1:1) at  
0.1 mL/sec

- 6) Washed column with 1 x 7.5 mL of methanol at 0.1 mL/sec
  - 7) Washed column with 0.01 M ammonia in methanol
  - 8) Eluted column with 7.5 mL of 1 M ammonia in methanol and collect into a tared receiving tube at 0.05 mL/sec.
- 5 All solution/solvent deliveries were followed by 1.0 mL of air and a 5 sec push delay was used after loading reaction contents onto the ion exchange column. The product solution was concentrated on a Savant Speed Vac (approx. 2 mm Hg for 20 hr) to afford the target compound.
- Syntheses requiring further purification were subjected to preparative HPLC
- 10 (YMC S3 ODS 50X100 mm, 30 mL/min, 10 minute gradient of 10-90% aqueous methanol with 0.1%TFA, monitored at 220 nm). The appropriate fractions were combined and concentrated under vacuum. The residues were dissolved in methanol (5 mL) and 1N HCl (1 mL) and concentrated on a Savant Speed Vac (approx. 2 mm Hg for 20 hr) to afford the target
- 15 compound. Target compounds were characterized by analytical HPLC and mass spectrometry.

**Examples 202-219**

- To a mixture of compound Compound A of Example 4 (3.83 g, 15.4 mmol) and 4-imidazolecarboxaldehyde (2.22g, 23.1 mmol) in 120 mL of CH<sub>2</sub>Cl<sub>2</sub> and 3 mL of AcOH at room temperature was added NaBH(OAc)<sub>3</sub> (4.89 g, 23.1 mmol). The mixture was stirred for 1.5 hours, diluted with 200 mL of CH<sub>2</sub>Cl<sub>2</sub>, and washed with 5% NaHCO<sub>3</sub>. The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated in vacuo. Flash chromatography of the residue on silica (eluting with 5% MeOH/CH<sub>2</sub>Cl<sub>2</sub> and trace NH<sub>4</sub>OH) afforded 2.01 g (40%) of 2,3,4,5-tetrahydro-4-[(1,1-dimethylethoxy)-carbonyl]-1-(1H-imidazol-4-yl-methyl)-1H-1,4-benzodiazepine. An additional 0.42 g (8%) of product was obtained by stirring 1.5 g of a high R<sub>f</sub> material in 1:1:1 THF/MeOH/NH<sub>4</sub>OH, followed by extraction with EtOAc, and flash chromatography.
- Hydroxymethyl resin (3.5 g, 6.58 mmol, 1.88 mmol/g) was swelled with 50 mL of 1,2-dichloroethane for 45 min at room temperature in a 125 mL shake flask. To this was added paraformaldehyde (0.15 g, 5.0 mmol). HCl (g) was bubbled through the mixture for 15 min. Then, an additional amount of paraformaldehyde (0.15 g, 5.0 mmol) was added to the reaction mixture. HCl (g) was bubbled through the mixture with shaking for 4h. The 1,2-dichloroethane was removed and the resin was rinsed with 1,2-dichloroethane (4 x 20 mL).
- The resin was suspended in 20 mL of 1,2-dichloroethane and then treated with a solution of 2,3,4,5-tetrahydro-4-[(1,1-dimethylethoxy)-carbonyl]-1-(1H-imidazol-4-yl-methyl)-1H-1,4-benzodiazepine (2.23 g, 6.78 mmol) in 25 mL of 1,2-dichloroethane and 6 mL of DIEA. The mixture was shaken at room temperature for 12 h. MeOH (2 mL) was added and the mixture was shaken for an additional 1.5 h. The solvent was removed and the resin was rinsed sequentially with 1,2-dichloroethane (2 x 20 mL), DMF (2 x 20 mL), and MeOH (2 x 20 mL). The material was dried in vacuo to afford 4.58 g (67%) of resin containing imidazole-bound 2,3,4,5-tetrahydro-4-[(1,1-dimethylethoxy)-carbonyl]-1-(1H-imidazol-4-yl-methyl)-1H-1,4-benzodiazepine (%N=4.39). To 150 mg (0.135 mmol, 0.90 mmol/g) of this resin in a 5 mL polypropylene syringe barrel was added 1.5 mL of 3% Et<sub>3</sub>SiH in CH<sub>2</sub>Cl<sub>2</sub> and 0.5 mL of TFA. The tube was placed in a vac-elute chamber (capacity for 24 syringe barrels) and the entire apparatus was shaken on an orbital shaker for 3 h. The solvent was removed and the resin was rinsed sequentially with 2 mL

- each of CH<sub>2</sub>Cl<sub>2</sub>, 25% Et<sub>3</sub>N/CH<sub>2</sub>Cl<sub>2</sub>, MeOH, DMF, and CH<sub>2</sub>Cl<sub>2</sub>. The resin was swelled with 0.5 mL of a DMF solution containing 1M DIEA and 0.5M HOBt. To this was added 50 mg of carboxylic acid, followed by 1.5 mL of a CH<sub>2</sub>Cl<sub>2</sub> solution containing 0.2M EDC. The mixture was shaken for 18 h.
- 5 The solvent was removed and the resin was rinsed sequentially with 2 mL each of CH<sub>2</sub>Cl<sub>2</sub>, 25% Et<sub>3</sub>N/CH<sub>2</sub>Cl<sub>2</sub>, MeOH, DMF, and CH<sub>2</sub>Cl<sub>2</sub>. The coupling procedure was repeated. The products were cleaved from the resin by shaking for 18 h in the presence of a HBr/TFA/thioanisole solution (prepared by mixing 45 mL of TFA, 1.25 mL of thioanisole, and 5 mL of 30% HBr/HOAc).
- 10 The solvent was removed and the resin was rinsed with MeOH (3 x 3 mL). The solvent was removed in vacuo, and the residue was purified by HPLC (C18, 50 x 100mm, 10%-90% MeOH with 0.1% TFA, 10 min gradient, 20 mL/min). Target compounds were characterized by analytical HPLC and mass spectrometry.

20 **(R)-7-Bromo-2,3,4,5-tetrahydro-1-(1H-imidazol-4-ylmethyl)-4-(methylsulfonyl)-3-(phenylmethyl)-1H-1,4-benzodiazepine, hydrochloride.**

**A. (R)-7-Bromo-2,3,4,5-tetrahydro-3-(phenylmethyl)-1H-1,4-benzodiazepin-2,5-dione**

A stirred solution of bromoisatoic anhydride (150 g, 0.62 mol) and D-phenylalanine methyl ester hydrochloride (127.3 g, 0.59 mol) in the presence of 4-dimethylaminopyridine (2 g) in pyridine (1500 mL) was heated at reflux under argon for 3 days. The pyridine was removed in vacuo and the residue was dissolved in methylene chloride (3 L). This solution was washed with 10% HCl solution and brine. The organic solution was dried and concentrated in vacuo to a small volume. The solid thus formed was collected and dried to give 152 g (71%) of Compound A, mp 242-243°C.

**B. (R)-7-Bromo-2,3,4,5-tetrahydro-3-(phenylmethyl)-1H-1,4-benzodiazepine**

A stirred solution Compound A (30 g, 87 mmol) in anhydrous THF (870 mL) under argon was treated with a solution of borane-tetrahydrofuran complex (440 mL of a 1 M solution, 440 mmol) at room temperature. The solution was slowly heated to reflux and heated at reflux for 18 h. The mixture was cooled to 0°C, and methanol (150 mL) was added to destroy excess of BH<sub>3</sub>. The combined EtOAc extracts were washed with saturated NaHCO<sub>3</sub> solution and brine, dried over anhydrous MgSO<sub>4</sub> and evaporated to give a foam. This was flash-chromatographed on a column of silica gel (E. Merck 230-400 mesh,

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☒ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐

The additional search fees were accompanied by the applicant's protest.

☒

No protest accompanied the payment of additional search fees.

### BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

- I. Claims 1-7 (final products) claims 14-17 (intermediates) and claim 8 (first method of use)
- II. Claim 9 (second method of use).
- III. Claim 10 (third method of use).
- IV. Claim 11 (fourth method of use).
- V. Claim 12 (fifth method of use).
- VI. Claim 13 (sixth method of use).

There is no unity of invention between the various methods of use since each method treats a different disease and the result of each method is different. Accordingly, the claims are not so linked by a special technical within the meaning of PCT Rule 13.2 so as to form a single inventive concept.
